

Utility Record Search and Compilation

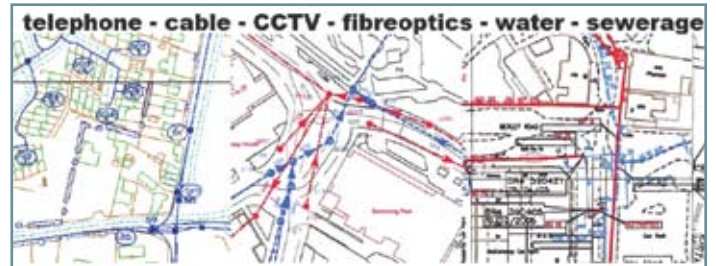

LandScope Engineering offers a fully utility record search and compilation service. This may include records from both statutory service providers and private sources. The service may be ordered stand-alone or incorporated to a LandScope utility field mapping campaign.

Applications include:

- Project overview planning
- Developing works specifications
- Input to desk top study and Underground Infrastructure Mapping campaign
- Site safety briefs

Statutory Service Plan Compilation

The compilation of statutory service plans for a specific site can be very time consuming and often it is rather difficult to define exactly who owns and operates what and where. Some data is available from internet sites however the vast majority must be applied for in writing and often require pre-established accounts. There are currently in excess of seventy different underground asset undertakers in the UK and there is not a single platform or format for data deliverable. The basic record compilation service sources statutory data from up to 30 Providers. Wherever possible web based systems of enquiry are utilised to minimise turn-around time. Data may be delivered simply as received from the providers or complemented with a report or a composite drawing of the various data on a site plan, topographical survey or Ordnance Survey MasterMap base.

Site View

An established customer reported that during a three month period 5 out of 8 site accidents involving underground utilities and services may have been avoided with improved communication of information. In these cases there was data available on the location of underground infrastructure however, for whatever reason, this information had neither been received nor considered by the excavator.

Therefore in response to our customer requests LandScope have developed a service and utility map product designed specifically to assist construction site workers and in particular those who have a responsibility for excavation and other invasive works. Based on the results of our established utility and mapping services, detailed above, Site View is an end-user friendly, hard-copy presentation of all available underground service and utility data.

Features include:

- Cab friendly A4 format
- Weather-proof laminated pages
- Site Overview - plan at an appropriate scale
- Detail Congestion - larger scale plans of specific areas
- Statutory Plans and Data
- Composite Statutory Data Plans
- Other Site Data - as relevant
- Specific Company HSE Guidance and Instruction
- HSG47 Guidelines
